

# maix.fs

maix.fs module

You can use `maix.fs` to access this module with MaixPy  
This module is generated from `MaixPy` and `MaixCDK`

## 1. Module

No module

## 2. Enum

### 2.1. SEEK

SEEK enums

| item   | describe                                       |
|--------|------------------------------------------------|
| values | <b>SEEK_SET</b> : Seek from beginning of file. |
|        | <b>SEEK_CUR</b> : Seek from current position.  |
|        | <b>SEEK_END</b> : Seek from end of file.       |

C++ defination code:

```

1 | enum SEEK
2 | {
3 |     SEEK_SET = 0, // Seek
4 |     from beginning of file.
5 |     SEEK_CUR = 1, // Seek
6 |     from current position.
       SEEK_END = 2, // Seek
       from end of file.
   }

```

## 3. Variable

## 4. Function

### 4.1. isabs

```

1 | def isabs(path: str) -> bool

```

Check if the path is absolute path

| item   | description                   |
|--------|-------------------------------|
| param  | path: path to check           |
| return | true if path is absolute path |

C++ defination code:

```

1 | bool isabs(const std::string
   &path)

```

### 4.2. isdir

```

1 | def isdir(path: str) -> bool

```

Check if the path is a directory, if not exist, throw exception

| item   | description                 |
|--------|-----------------------------|
| param  | path: path to check         |
| return | true if path is a directory |

C++ definition code:

```
1 | bool isdir(const std::string  
   | &path)
```

## 4.3. isfile

```
1 | def isfile(path: str) -> bool
```

Check if the path is a file, if not exist, throw exception

| item   | description            |
|--------|------------------------|
| param  | path: path to check    |
| return | true if path is a file |

C++ definition code:

```
1 | bool isfile(const std::string  
   | &path)
```

## 4.4. islink

```
1 | def islink(path: str) -> bool
```

Check if the path is a link, if not exist, throw exception

| item   | description            |
|--------|------------------------|
| param  | path: path to check    |
| return | true if path is a link |

C++ definition code:

```
1 | bool islink(const std::string  
   | &path)
```

## 4.5. symlink

```
1 | def symlink(src: str, link: str,  
   | force: bool = False) -> maix.err.Err
```

Create soft link

| item  | description                                                                                                                                           |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| param | <b>src</b> : real file path<br><b>link</b> : link file path<br><b>force</b> : force link, if already have link file, will delet it first then create. |

C++ definition code:

```
1 | err::Err symlink(const  
   | std::string &src, const  
   | std::string &link, bool force =  
   | false)
```

## 4.6. exists

```
1 | def exists(path: str) -> bool
```

Check if the path exists

| item   | description         |
|--------|---------------------|
| param  | path: path to check |
| return | true if path exists |

C++ definition code:

```
1 | bool exists(const std::string  
   &path)
```

## 4.7. mkdir

```
1 | def mkdir(path: str, exist_ok: bool  
   = True, recursive: bool = True) ->  
   maix.err.Err
```

Create a directory recursively

| item   | description                                                                                                                                                                                                                |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| param  | <b>path</b> : path to create<br><b>exist_ok</b> : if true, also return true if directory already exists<br><b>recursive</b> : if true, create directory recursively, otherwise, only create one directory, default is true |
| return | err::ERR_NONE(err.Err.ERR_NONE in MaixPy) if success, other error code if                                                                                                                                                  |

| item                                                                                                                | description |
|---------------------------------------------------------------------------------------------------------------------|-------------|
|                                                                                                                     | failed      |
| C++ definition code:                                                                                                |             |
| <pre>1   err::Err mkdir(const std::string       &amp;path, bool exist_ok = true, bool       recursive = true)</pre> |             |

## 4.8. rmdir

```
1 | def rmdir(path: str, recursive: bool
    | = False) -> maix.err.Err
```

Remove a directory

| item                                                                                     | description                                                                                                                                        |
|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>param</b>                                                                             | <b>path</b> : path to remove<br><b>recursive</b> : if true, remove directory recursively, otherwise, only remove empty directory, default is false |
| <b>return</b>                                                                            | err::ERR_NONE(err.Err.ERR_NONE in MaixPy) if success, other error code if failed                                                                   |
| C++ definition code:                                                                     |                                                                                                                                                    |
| <pre>1   err::Err rmdir(const std::string       &amp;path, bool recursive = false)</pre> |                                                                                                                                                    |

## 4.9. remove

```
1 | def remove(path: str) ->
    maix.err.Err
```

Remove a file

| item          | description                                                                      |
|---------------|----------------------------------------------------------------------------------|
| <b>param</b>  | <b>path:</b> path to remove                                                      |
| <b>return</b> | err::ERR_NONE(err.Err.ERR_NONE in MaixPy) if success, other error code if failed |

C++ defination code:

```
1 | err::Err remove(const std::string
    &path)
```

## 4.10. rename

```
1 | def rename(src: str, dst: str) ->
    maix.err.Err
```

Rename a file or directory

| item          | description                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------|
| <b>param</b>  | <b>src:</b> source path<br><b>dst:</b> destination path, if destination dirs not exist, will auto create |
| <b>return</b> | err::ERR_NONE(err.Err.ERR_NONE in MaixPy) if success, other error code if failed                         |

C++ definition code:

```
1 | err::Err rename(const std::string  
   | &src, const std::string &dst)
```

## 4.11. sync

```
1 | def sync() -> None
```

Sync files, ensure they're written to disk from RAM

C++ definition code:

```
1 | void sync()
```

## 4.12. getsize

```
1 | def getsize(path: str) -> int
```

Get file size

| item   | description                                    |
|--------|------------------------------------------------|
| param  | path: path to get size                         |
| return | file size if success, -err::Err code if failed |

C++ definition code:

```
1 | int getsize(const std::string  
   | &path)
```

## 4.13. dirname

```
1 | def dirname(path: str) -> str
```

Get directory name of path

| item   | description                                |
|--------|--------------------------------------------|
| param  | <b>path:</b> path to get dirname           |
| return | dirname if success, empty string if failed |

C++ defination code:

```
1 | std::string dirname(const  
   | std::string &path)
```

## 4.14. basename

```
1 | def basename(path: str) -> str
```

Get base name of path

| item   | description                                 |
|--------|---------------------------------------------|
| param  | <b>path:</b> path to get basename           |
| return | basename if success, empty string if failed |

C++ defination code:

```
1 | std::string basename(const  
   | std::string &path)
```

## 4.15. abspath

```
1 | def abspath(path: str) -> str
```

Get absolute path

| item   | description                                      |
|--------|--------------------------------------------------|
| param  | path: path to get absolute path                  |
| return | absolute path if success, empty string if failed |

C++ definition code:

```
1 | std::string abspath(const  
   | std::string &path)
```

## 4.16. getcwd

```
1 | def getcwd() -> str
```

Get current working directory

| item   | description                             |
|--------|-----------------------------------------|
| return | current working directory absolute path |

C++ definition code:

```
1 | std::string getcwd()
```

## 4.17. realpath

```
1 | def realpath(path: str) -> str
```

Get realpath of path

| item   | description                                 |
|--------|---------------------------------------------|
| param  | <b>path:</b> path to get realpath           |
| return | realpath if success, empty string if failed |

C++ definition code:

```
1 | std::string realpath(const  
   | std::string &path)
```

## 4.18. splitext

```
1 | def splitext(path: str) -> list[str]
```

Get file extension

| item   | description                                                       |
|--------|-------------------------------------------------------------------|
| param  | <b>path:</b> path to get extension                                |
| return | prefix_path and extension list if success, empty string if failed |

C++ definition code:

```
1 | std::vector<std::string>  
   | splitext(const std::string &path)
```

## 4.19. listdir

```
1 | def listdir(path: str, recursive:
    bool = False, full_path: bool =
    False) -> list[str]
```

List files in directory

| item   | description                                                                                                                                                                                                                                         |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| param  | <p><b>path:</b> path to list</p> <p><b>recursive:</b> if true, list recursively, otherwise, only list current directory, default is false</p> <p><b>full_path:</b> if true, return full path, otherwise, only return basename, default is false</p> |
| return | files list if success, nullptr if failed, you should manually delete it in C++.                                                                                                                                                                     |

C++ definition code:

```
1 | std::vector<std::string>
    *listdir(const std::string &path,
    bool recursive = false, bool
    full_path = false)
```

## 4.20. open

```
1 | def open(path: str, mode: str) ->
    File
```

Open a file, and return a File object

| item   | description                                                                                                                         |
|--------|-------------------------------------------------------------------------------------------------------------------------------------|
| param  | <b>path:</b> path to open<br><b>mode:</b> open mode, support "r", "w", "a", "r+", "w+", "a+", "rb", "wb", "ab", "rb+", "wb+", "ab+" |
| return | File object if success(need to delete object manually in C/C++), nullptr if failed                                                  |

C++ definition code:

```
1 | fs::File *open(const std::string
    | &path, const std::string &mode)
```

## 4.21. tempdir

```
1 | def tempdir() -> str
```

Get temp files directory

| item   | description          |
|--------|----------------------|
| return | temp files directory |

C++ definition code:

```
1 | std::string tempdir()
```

## 5. Class

### 5.1. File

## File read write ops

C++ definition code:

```
1 | class File
```

### 5.1.1. \_\_init\_\_

```
1 | def __init__(self) -> None
```

Construct File object

| item   | description |
|--------|-------------|
| type   | func        |
| static | False       |

C++ definition code:

```
1 | File()
```

### 5.1.2. open

```
1 | def open(self, path: str, mode: str)
    -> maix.err.Err
```

Open a file

| item  | description                                                            |
|-------|------------------------------------------------------------------------|
| type  | func                                                                   |
| param | <b>path:</b> path to open<br><b>mode:</b> open mode, support "r", "w", |

| item   | description                                                                      |
|--------|----------------------------------------------------------------------------------|
|        | "a", "r+", "w+", "a+", "rb", "wb", "ab", "rb+", "wb+", "ab+"                     |
| return | err::ERR_NONE(err.Err.ERR_NONE in MaixPy) if success, other error code if failed |
| static | False                                                                            |

C++ definition code:

```
1 | err::Err open(const std::string
    &path, const std::string &mode)
```

### 5.1.3. close

```
1 | def close(self) -> None
```

Close a file

| item   | description |
|--------|-------------|
| type   | func        |
| static | False       |

C++ definition code:

```
1 | void close()
```

### 5.1.4. read

```
1 | def read(self, size: int) ->
    list[int]
```

Read data from file API2

| item          | description                                                             |
|---------------|-------------------------------------------------------------------------|
| <b>type</b>   | func                                                                    |
| <b>param</b>  | <b>size:</b> max read size                                              |
| <b>return</b> | bytes data if success(need delete manually in C/C++), nullptr if failed |
| <b>static</b> | False                                                                   |

C++ definition code:

```
1 | std::vector<uint8_t> *read(int
    size)
```

### 5.1.5. readline

```
1 | def readline(self) -> str
```

Read line from file

| item          | description                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------|
| <b>type</b>   | func                                                                                                       |
| <b>return</b> | line if success, None(nullptr in C++) if failed. You need to delete the returned object manually in C/C++. |
| <b>static</b> | False                                                                                                      |

C++ definition code:

```
1 | std::string *readline()
```

### 5.1.6. eof

```
1 | def eof(self) -> int
```

End of file or not

| item   | description                           |
|--------|---------------------------------------|
| type   | func                                  |
| return | 0 if not reach end of file, else eof. |
| static | False                                 |

C++ definition code:

```
1 | int eof()
```

### 5.1.7. write

```
1 | def write(self, buf: list[int]) -> int
```

Write data to file API2

| item  | description          |
|-------|----------------------|
| type  | func                 |
| param | buf: buffer to write |

| item          | description                                     |
|---------------|-------------------------------------------------|
| <b>return</b> | write size if success, -err::Err code if failed |
| <b>static</b> | False                                           |

C++ defination code:

```
1 | int write(const
   | std::vector<uint8_t> &buf)
```

### 5.1.8. seek

```
1 | def seek(self, offset: int, whence:
   | int) -> int
```

Seek file position

| item          | description                                                       |
|---------------|-------------------------------------------------------------------|
| <b>type</b>   | func                                                              |
| <b>param</b>  | <b>offset:</b> offset to seek<br><b>whence:</b> @see maix.fs.SEEK |
| <b>return</b> | new position if success, -err::Err code if failed                 |
| <b>static</b> | False                                                             |

C++ defination code:

```
1 | int seek(int offset, int whence)
```

### 5.1.9. tell

```
1 | def tell(self) -> int
```

Get file position

| item   | description                                        |
|--------|----------------------------------------------------|
| type   | func                                               |
| return | file position if success, -err::Err code if failed |
| static | False                                              |

C++ defination code:

```
1 | int tell()
```

### 5.1.10. flush

```
1 | def flush(self) -> maix.err.Err
```

Flush file

| item   | description                                                                      |
|--------|----------------------------------------------------------------------------------|
| type   | func                                                                             |
| return | err::ERR_NONE(err.Err.ERR_NONE in MaixPy) if success, other error code if failed |
| static | False                                                                            |

C++ defination code:

```
1 | err::Err flush()
```
